Dear Editor,

I am pleased to submit our manuscript entitled “Temporal Attention-Enhanced Lightweight CNN for Student Engagement Detection on Edge Devices” for consideration for publication in *Electronics*.

This paper proposes a novel framework combining:

1. A multi-scale Channel-Spatial Attention Module (CSAM) with parallel 3×3, 5×5, 7×7 convolutions and adaptive fusion.
2. A BiLSTM-based temporal aggregation module for video-level engagement prediction.
3. Deployment-oriented evaluation on edge hardware.

Key results:

- FER2013: 70.5% accuracy (5-fold CV)
- CK+ cross-dataset: 71.9% accuracy
- DAiSEE: 94.8% video-level accuracy (vs 61.2% frame-level)

The temporal aggregation module dramatically improves video-level performance, demonstrating that temporal modeling is essential for engagement detection. The complete pipeline runs at 53 fps on GPU, suitable for real-time classroom deployment.

Both authors have approved the manuscript and declare no conflicts of interest. I look forward to your decision.

Sincerely,

Huanjie Yu
